

132 cm

The **conveyor**, made from shock-proof polypropylene, is oscillating and mounted on anti-vibration rubbers; this feature, combined with its special profile, allows the cutter bar to discharge grass under the most demanding working conditions, reducing clogging and **making work more efficient**.

The **oil-bath movement** reduces wear, does not need **any special maintenance** and offers a durable service life.

The **adjustable support skids** (a standard feature) allows the operator to easily choose the cutting height.

The **steel blade holders** are **self-adjustable**, their function is to set aside any free-play between the cutter bar and its movement. No adjustment needed.

The **side protectors** (also a standard feature) avoid damage to the cutter bar, should a solid item be encountered.

The **cutter bar coupling** is made of steel and it is easily adjusted via two plates, to clear free-play between the movement and the cutter bar.

The central middle-cut toothed DOUBLE-BLADE CUTTING BAR PRO is equipped with **two balancing, counter-moving cutter blades** to reduce vibrations to the minimum and ensure maximum **comfort for the operator**.

It is a **professional** cutter bar suitable for any kind of grass, the perfect solution to avoid **clogging**. This cutting bar can be used to cut hay, to clean up **rough pastures, orchards** and to maintain **green areas** where it is fundamental to have a low environmental impact to preserve biodiversity. Both the high-quality steel and the self-adjustable blade holders ensure **excellent quality of work**.

The **cutter bar teeth** are jagged to ensure a durable service life and reduce wear; these alloy-steel teeth are manufactured by "Busatis Austria" and are subjected to special heat treatment.
